

ida-x86emu

x86 Emulator Plugin for IDA Pro

Chris Eagle
cseagle@nps.edu

Outline

- Introduction
- Operation
- Demos
- Summary

Background

- IDA Pro
 - Interactive Disassembler Professional
 - <http://www.datarescue.com/idabase>
- Premier disassembly tool for reverse engineers
 - Handles many families of assembly language
- Runs on Windows
 - Linux in the works!

What?

- ida-x86emu is a plugin for IDA Pro that allows emulated execution of x86 instructions
- Written in C++
 - Currently packaged as VC++ 6.0 project
- Available here:
 - <http://sourceforge.net/projects/ida-x86emu>

Why?

- Hand tracing assembly language is a pain in the ass
- Anti-reverse engineering techniques attempt to obfuscate code paths
- Allows automated unpacking/decrypting of "protected" binaries
 - UPX, burneye, shiva, tElock, ASPack, ...

Primary Motivation

- Getting at protected executables
 - Most viruses/worms are protected in some way
 - Often tweaked UPX
- Challenge for static reverse engineering is getting past the protection
 - ida-x86emu allows you to "run" through the decryption routine within IDA Pro

Outline

- Introduction
- **Operation**
- Demos
- Summary

IDA Pro

- Load the binary of interest
- IDA builds a database to characterize each byte of the binary
- Performs detailed analysis of code
 - Recognizes functions boundaries and library calls
 - Recognizes data types for library calls

Obfuscated Code

- Challenging for IDA
- Usually only get sensible output for entry function
- Protected program appears as data rather than code because it is obfuscated/encrypted
- Jumps into middle of instructions confuse flow analysis

The Plugin

- Two pieces
 - User interface
 - Windows-specific gui code
 - Handles dialog boxes
 - x86 emulator
 - Platform independent
 - Executes a single instruction at a time
 - Reads from IDA database or user-supplied memory block

Console

The screenshot shows a window titled "x86 Emulator" with the following components:

- Registers:** A table of 10 registers with their current values.

EAX	0x00000000	EBP	0x00000000
EBX	0x00000000	ESP	0xC0000000
ECX	0x00000000	ESI	0x00000000
EDX	0x00000000	EDI	0x00000000
EFLAGS	0x00000002	EIP	0x004AF000
- Control Buttons:** A vertical column of buttons on the right side: Step, Jump, Run, Skip, Run To Cursor, Dump, and Hide.
- Segments:** A button labeled "Segments" located below the registers.
- Stack:** A section labeled "Stack" containing a "Push Data" button.
- Memory Dump:** A text area at the bottom showing the memory address BFFFFFF0 and its contents: 00 00 00 00 00 00 00 00 03 48 1F 18 03 48 01 78.

Outline

- Introduction
- Operation
- Demos
- Summary

Using It

- Alt-F8 brings it up
- eip initialized to cursor
- Step and go
 - The plugin tells IDA to reorganize its code display based on ACTUAL code paths
 - Defeats jump into the middle of an instruction type obfuscation

Features

- Run to Cursor
 - No breakpoints yet
- Plugin supplies its own stack
 - Stack push places arguments on the stack
 - Useful if you want to setup a function call
- No dynamic memory at this point
 - Can fake small heap operations using the stack

UPX Demo

- One of the most common obfuscators
- Reversible using UPX itself
- UPX corruptors exist that break UPX's reversing capability
- No problem for the plugin

Burneye Demo

- Early ELF protector by Team TESO
- Actually embeds the entire protected ELF, including the ELF headers within
- Once decrypted, the protected binary can be dumped out of the IDA database

Shiva Demo

- Shiva is a binary protector
 - Similar goals to Burneye
- Multilevel encryption protects binary
- Polymorphic stage 1 decryptor
- Embedded key recovery functions for last stage decryption

```

Shiva Key Recovery

- Shiva contains 5 different types of encrypted blocks
- Each block gets its own key
 - Blocks of same type share the same key
- In this case we need to recover 5 keys in order to decrypt all of the types of blocks

Key Obfuscation

- Shiva contains a key reconstruction function for each type of crypt block
- Block decryption sequence
 - Identify block type (0-IV)
 - Call appropriate key reconstruction function
 - Decrypt block
 - Clear the key

Key Construction

- Functions are obfuscated
 - Similar to layer 1 decrypt
 - Differ from one binary to the next
 - Resistant to script-based recovery
- But
 - They are easy to locate
 - A table points to the start of each function

Key Extraction

- The plugin can be used to run the functions and collect the keys!
- Demo

Using the Keys

- With 5 keys in hand it is possible to decrypt all of the crypt blocks
- The plugin can be used to invoke Shiva's decryption function
 - Setup the stack
 - Pointer to the block
 - Pointer to the key
 - Step through the decryption function

Outline

- Introduction
- Operation
- Demos
- Summary

To Do

- Breakpoints
- Handle library calls
- Heap functionality
- Windows exception handling

Summary

- Acts as something of a "universal" decryption script for protected binaries
- Dramatically reduces time to reverse protected binaries
- Emulator code can be used independently of gui code to create automated unwrappers
 - Combine with ELF or PE parser
- Suggestions welcome
